Today we will learn how to download and install Java on Windows 10. If you are new to Java programming then this is the first step you need to perform. Until unless your java Windows 10 environment is set up properly, you will not be able to develop Java programs and run them successfully. How to install Java in Windows 10 Installing Java on Windows 10 is really easy, just follow the steps as follows: The first step is to download Java installation files from Oracle's website. Java 9 is the latest version, so go to this link and accept the license agreement. Then click on the download link for windows as shown in the below image and save the file. Note: If you are trying to install Java 8 or earlier, then you need to know whether your Windows 10 is 32-bit or 64-bit. It's because there are two different installers for Windows as seen in this link for Java 8 binaries. If your Windows 10 is 32-bit OS then download Windows x86 exe file, else download Windows x64 exe file. If you are not sure of your Windows version, you can easily check it in Settings > System Settings > About. Next step is to run the downloaded Java installer executable file. Just double click on it and follow the steps. Most of the time you don't need to check anything and go with default selection, below are images from my installation screens. They might differ a little bit based on your Java version installation but mostly it's the same as usual. Finally, we have to check if Java is installed properly or not. We can do that by using Java -version command in command prompt, as shown in below image. Note: In older Java versions and other Windows operating systems, you need to set up two environment variables to get it working. Go to System Properties (Right Click on My Computer and select Properties) > Advanced > Environment Variables. In the popup window, System variables section, click on New button and add a variable with the following details: Name: JAVA_HOME Value: C:\Program Files\Java\jdk1.6.0_25 After this, you need to edit the Path variable already present there. Just select the Path variable and click on the Edit button. In the popup window value section, go to the end and add the following ;C:\Program Files\Java\jdk1.6.0_25\bin (The colon is used as a delimiter, so don't miss that!) Now your setup is done and you can check it by opening a command prompt and running command java -version. In Windows 10 and Java 9, we don't need to do these manually. Java installer takes care of that and you can check environment variable Path value, as shown in the below image. Note that we don't need to set the JAVA_HOME variable. This is an optional step but highly recommended. If you want to get things done easily, you should install either Eclipse, IntelliJ Idea or NetBeans IDE that helps a lot in development of Java programs. Just download and install it with executable file, they are straight forward. That's all for downloading and installing Java on windows 10. Let me know if you face any issue in setting up the environment. What's after installing Java Now you are ready to learn Java programming, go through the articles on core Java tutorial and learn Java programming step by step. Note: A few years back, I made this video to install Java 9 on windows 10. Steps are still almost the same so you can watch it to get more ideas about it. Also if you want to have multiple Java versions and want to switch between them easily, then go through this short 2-minute video: Downloading IBM SPSS Statistics 23 IBM® SPSS® Statistics is the world's leading statistical software that is used to solve business and research problems by using ad hoc analysis, hypothesis testing, and predictive analytics.
